$2v_3 v = 1 v_2 1 3+v_2 3 v_1 v_2+v_1 v_3+v_2 v_3 1 = v_1 v_2+v_1 v_3+v_2 v_3 v_1 v_2+v_1 v_3+v_2 v_3$ Notice that > 0 and > 0 : Of course, we also need $1 > 0$: This holds if and only if: $v_3 > v_1 v_2 v_1 +v_2$: We now need to compute player A's equilibrium strategy. Let us assume that $v_3 > v_1 v_2 v_1 +v_2$

maximization condition is $\frac{\partial U}{\partial x} = 0$ implying that $x = 8$ is the optimal solution. For $\alpha = 1$ the solution is $x = 1/8$ and for $\alpha = 4$ it is $x = 1/2$. \square (c) Show that in general, smaller people should drink less than larger people.

Solution Manual Game Theory: An Introduction

Course Description This course provides a rigorous treatment of non-cooperative solution concepts in game theory, including rationalizability and Nash, sequential, and stable equilibria. It covers topics such as epistemic foundations, higher order beliefs, bargaining, repeated games, reputation, supermodular games, and global games.

In game theory, a solution concept is a formal rule for predicting how a game will be played. These predictions are called "solutions", and describe which strategies will be adopted by players and, therefore, the result of the game. The most commonly used solution concepts are equilibrium concepts, most famously Nash equilibrium. Many solution concepts, for many games, will result in more than one solution. This puts any one of the solutions in doubt, so a game theorist may apply a refinement to
